MEMORANDUM FOR AD/SH

One of the important recommendations which is being made in connection with our survey of OSI relates to electromagnetic interception intelligence in the higher frequencies which we have referred to as "noise listening." We are taking the position that (1) for intelligence reasons the collection should be planned and (2) that the data collected immediately be made available to a central analysis body so that the information thereby made available may be "harried" on an all-source basis with other intelligence.

I suggest that you start your shop at once in the preparation of a paper establishing the importance of this type of intelligence and the need for the procedure which you have suggested and which we have accepted in our recommendations.
